

Dipl.-Ing. Felix Lotz

System Architecture & Behavior Planning

System Architecture & Behavior Planning

TECHNISCHE
UNIVERSITÄT
DARMSTADT

Agenda

- **Motivation and Challenges of Architecture Design**
- **PROETA 3 Functional Architecture**
- **Insight into PROETA3 Behavior Planning Algorithm**
- **Summary**

System Architecture

Motivation & Challenge

- System Architecture
- Hardware Architecture

- (Functional) Software Architecture

System Architecture

Motivation & Challenge

- **Challenge 1: „Blank sheet of paper“**
 - **Problem with high degrees of freedom**

- **Challenge 2: Significance of software architecture**
 - **Architecture design takes place in early phase of system development**
 - **Architecture influences the development and implementation efficiency**
 - **Architecture influences the system understanding and complexity**

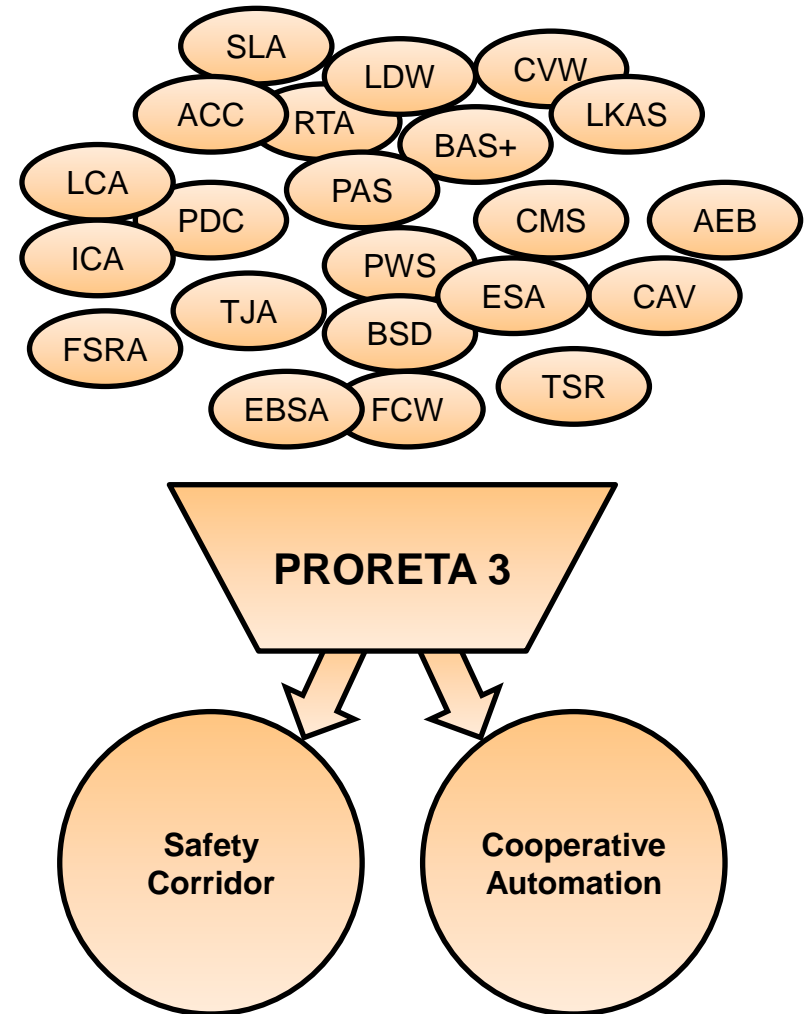

System Architecture

TECHNISCHE
UNIVERSITÄT
DARMSTADT

Motivation & Challenge

- Functional Requirements within PRORETA3

System Architecture

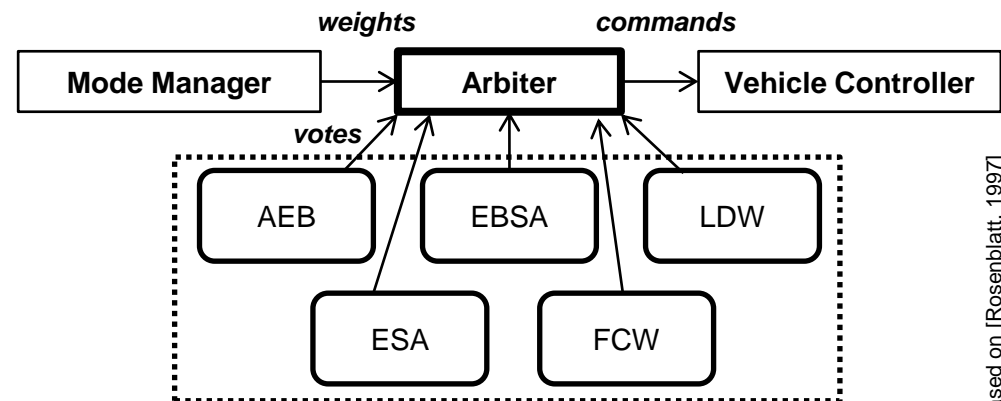

Motivation & Challenge

- Direct functional partitioning
 - modules directly depend on sensors and actuators
 - duplication of effort

- Reactive Architectures
 - Different behaviors compete over vehicle actuators
 - Command arbitration is required
 - Hard to optimize in complex environments / situations

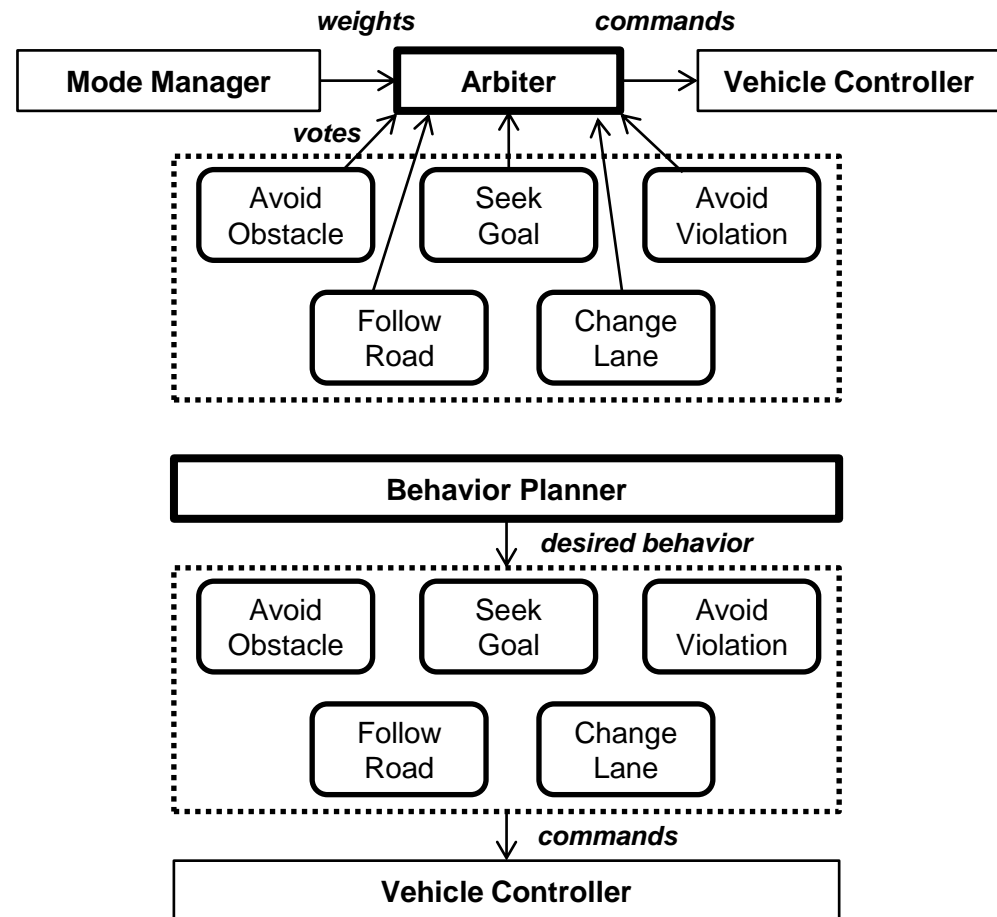

based on [Rosenblatt, 1997]

System Architecture

Behavior-based Approach for Mobile Robotics

- Generalized vehicle behaviors
- Reconfigure the decision process

- Layered Architectures
 - Hierarchically layered modules, e.g. organizational hierarchy
 - Decomposition of driving task in subtasks
 - Enables deliberate planning to reach long-term goals

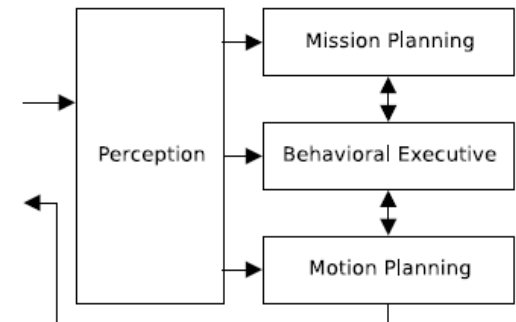

System Architecture

Layered Architectures in Praxis

- Fully automated vehicles

[Urmson, 2008]

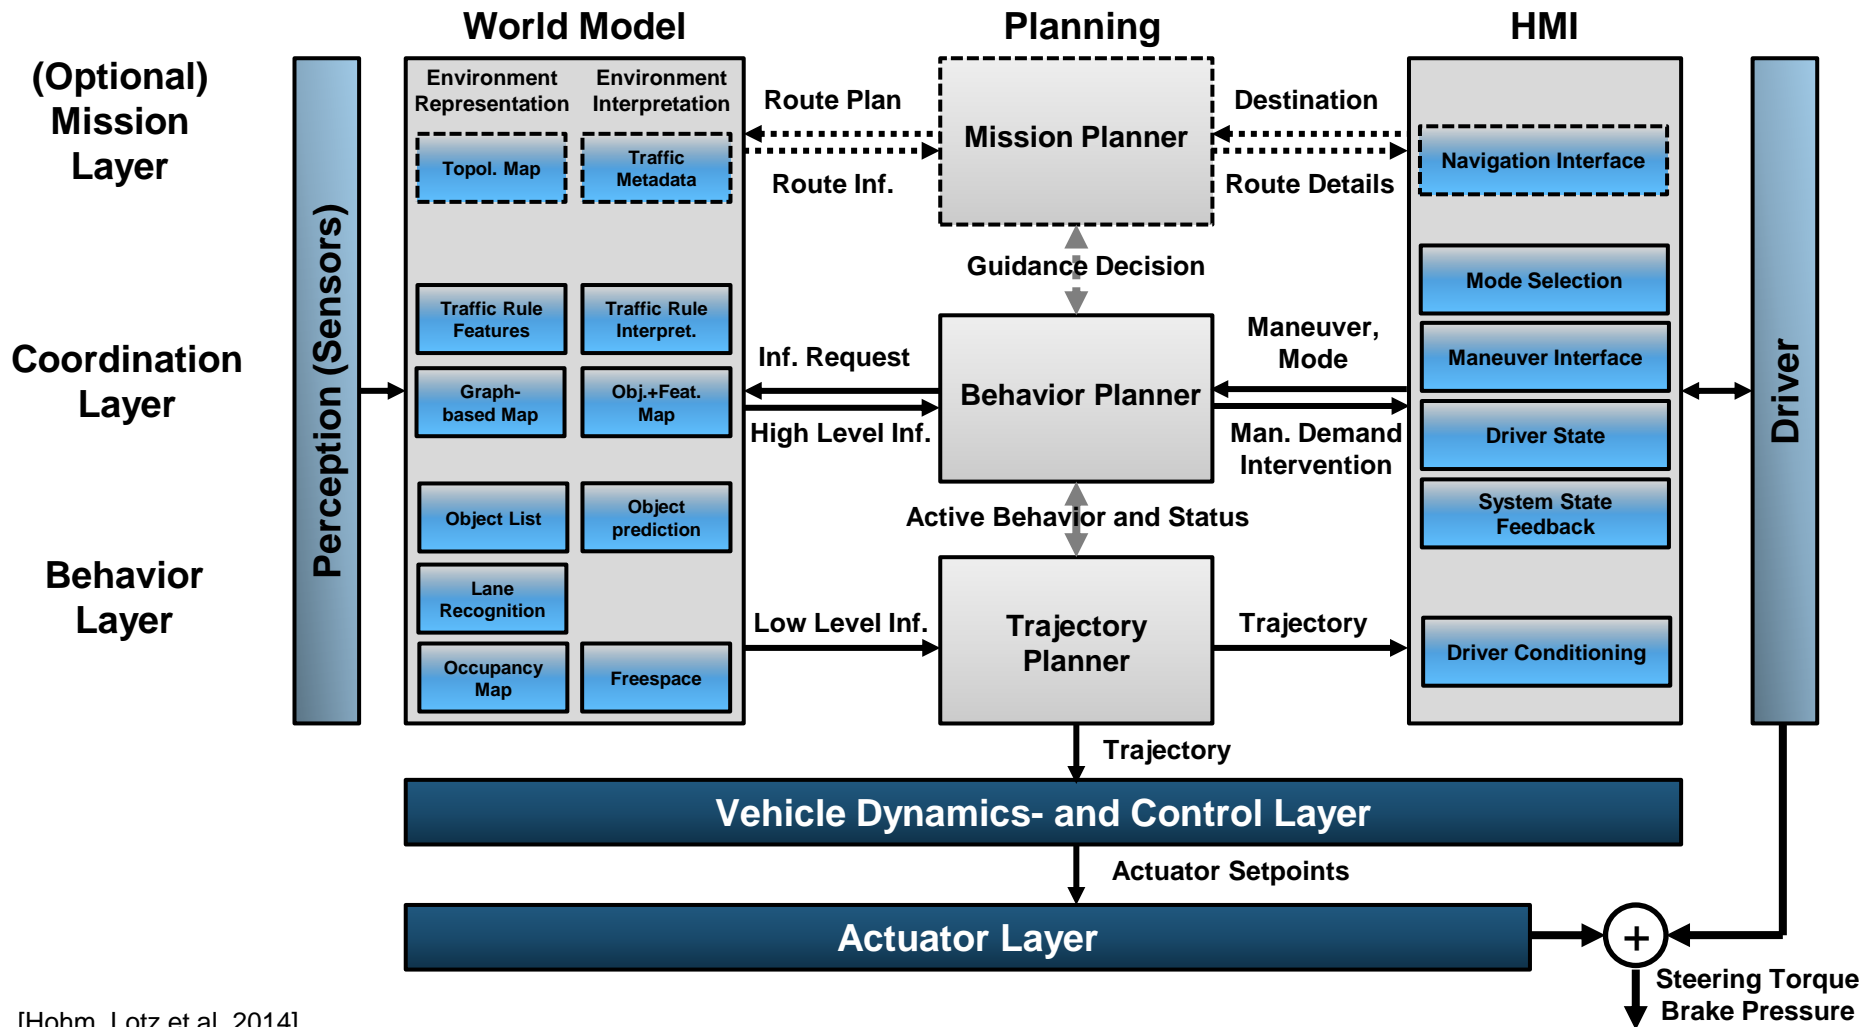

Unique selling points of PRORETA 3

- Intensive driver integration (shared vehicle control)
 - Safety Corridor: Assisted conventional driving
 - Cooperative Automation: Maneuver-based vehicle automation

PROETA3 Architecture Overview

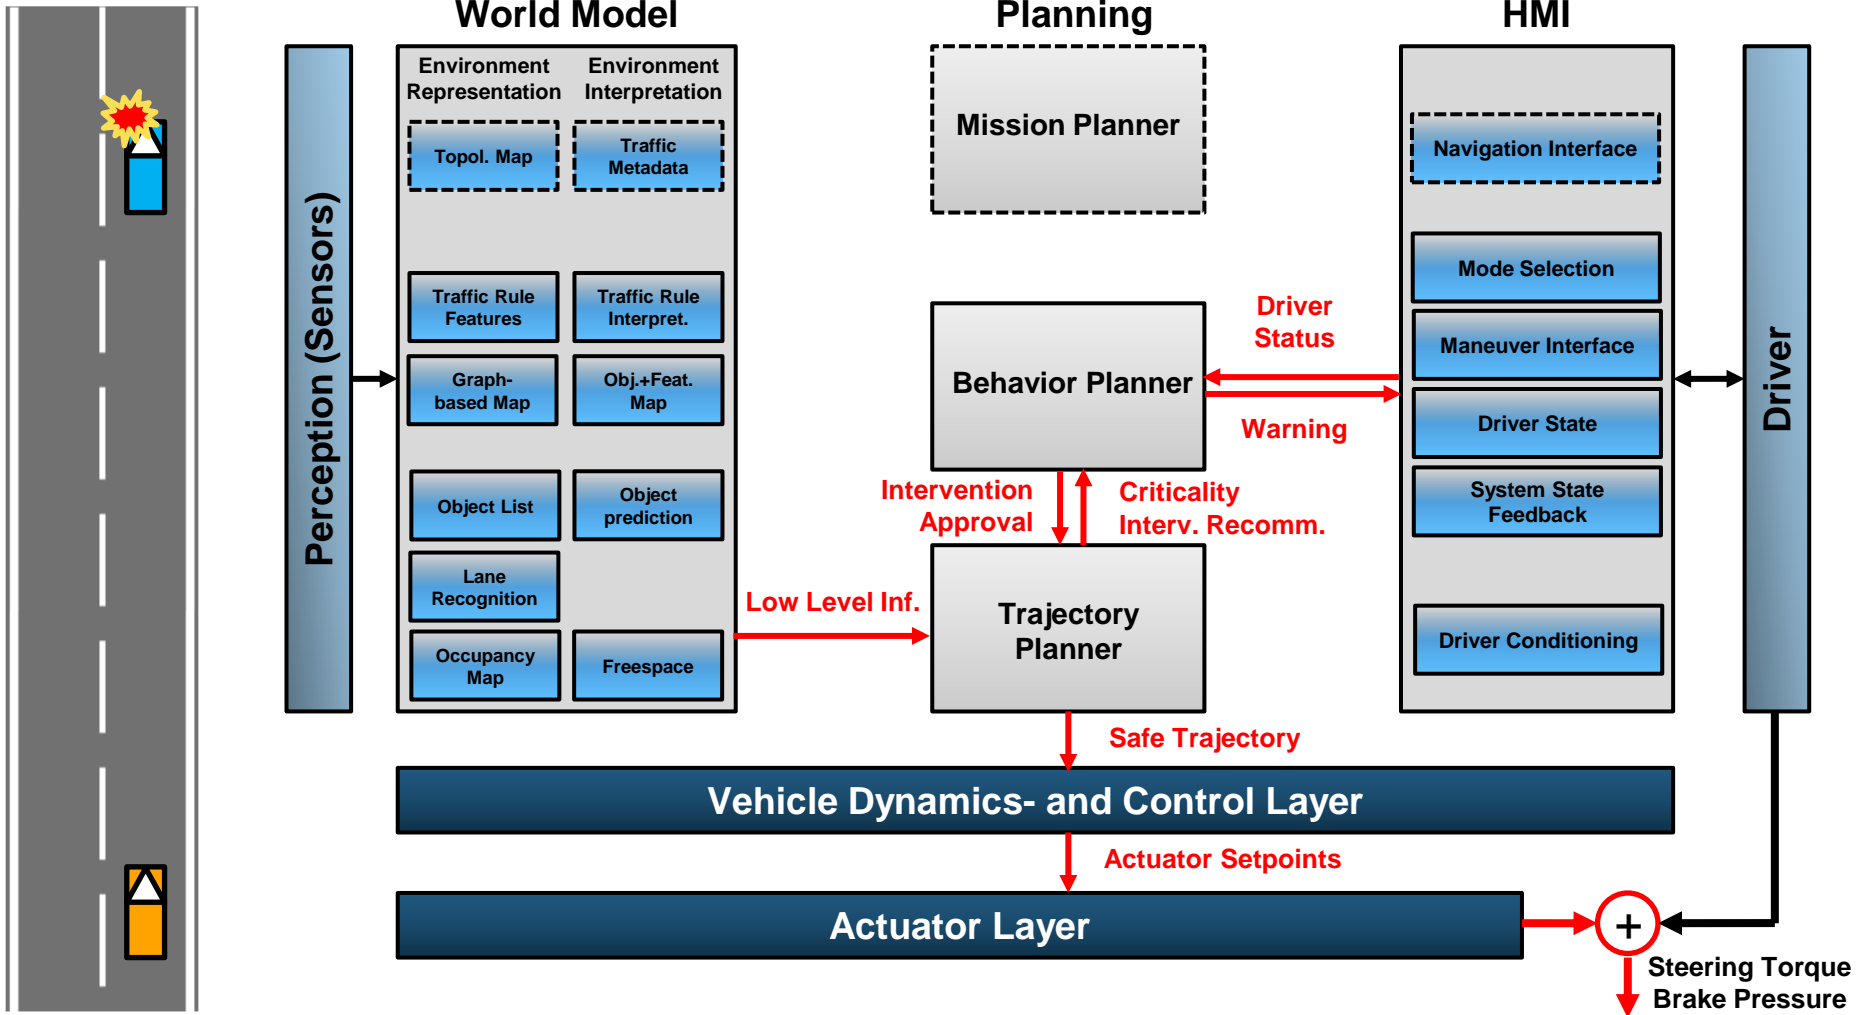

TECHNISCHE
UNIVERSITÄT
DARMSTADT

[Hohm, Lotz et al. 2014]

Example: Safety Corridor Intervention

Behavior Planning

TECHNISCHE
UNIVERSITÄT
DARMSTADT

Exemplary Situation within Cooperative Automation Mode

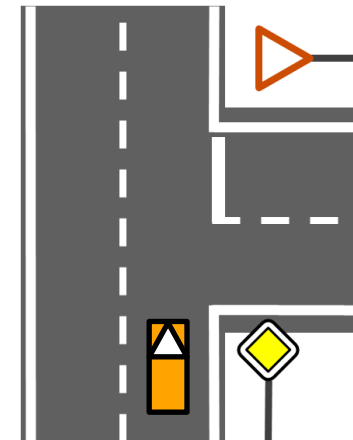

Behavior Planning

Requirements and Design Questions

- Mode Change SC → KA
- Approach / Crossing of Intersection:
 - How / when / how long are available maneuvers offered?
 - Is there a *default maneuver*?
 - What if driver suddenly changes decision?
 - How is yielding represented within implementation?
 - When is the turning maneuver finished?
 - ...

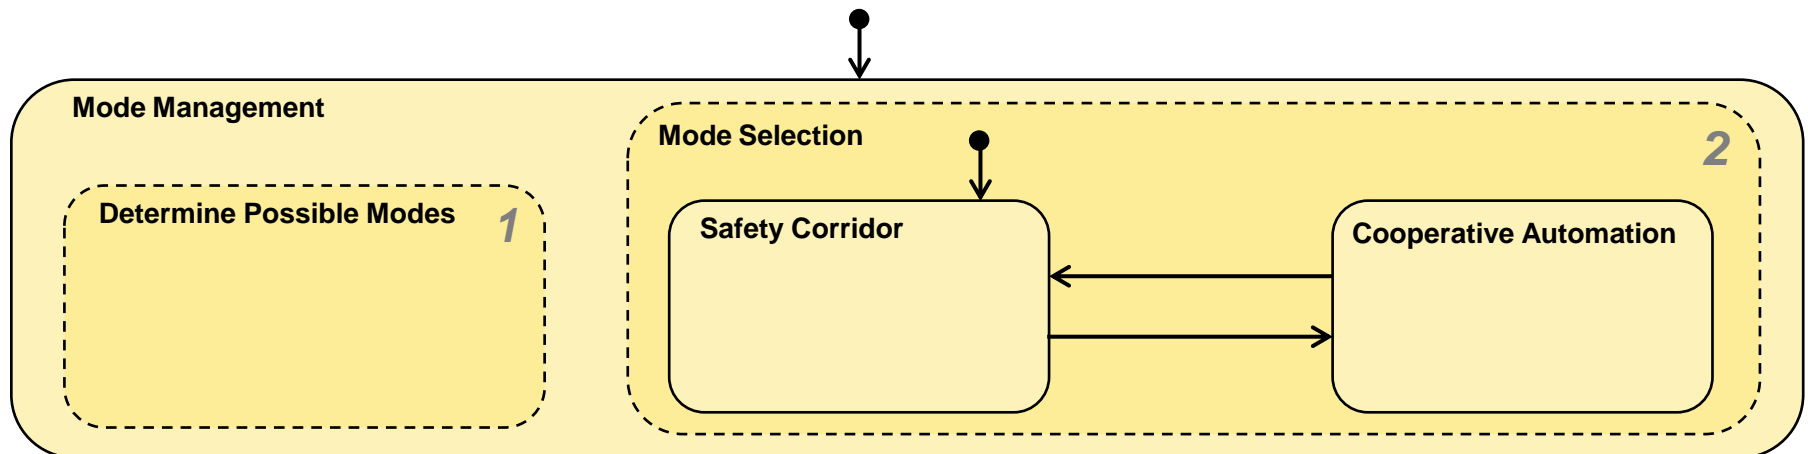

Behavior Planner

Implementation

- Requirements:
 - Traffic rules dictate specific vehicle behaviors
 - Driver delegates discrete vehicle maneuvers
 - → Implementation approach has to cope with discrete system states

Selected Implementation Approach: Hierarchical State Machine

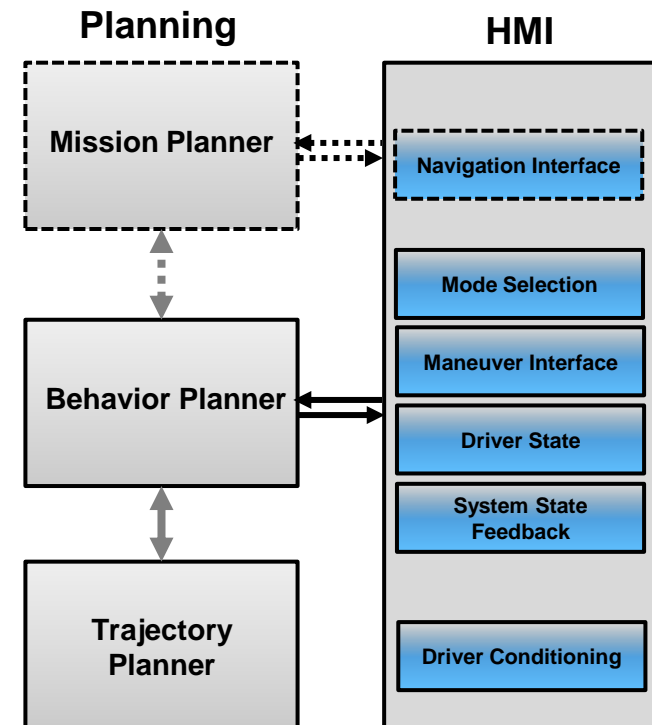

PRORETA 3 System Architecture

Summary

- The modular and layered architecture design allows a division of behavior decision and behavior execution
→ Each layer can be implemented independently
- Functional encapsulation results in error isolation and reduces the testing and debug effort
- The driver is explicitly represented within the system design → shared vehicle control
- Optional Mission Layer gives the opportunity to achieve higher degrees of automation without changing the architecture design
